Orbit AI — Webhook Backend

Starter code and deployment instructions for GitHub Pages + Render + Twilio

What this PDF contains

GitHub Pages hosts your dashboard, but it cannot run a persistent Python server. This guide adds a separate Flask backend on Render and a basic Twilio-compatible voice webhook. The sample plays a fixed greeting; it is not yet a conversational AI agent.

1. app.py

```
from flask import Flask, request
from twilio.twiml.voice_response import VoiceResponse

app = Flask(__name__)

@app.get("/")
def home():
    return {
        "app": "Orbit AI Backend",
        "status": "running"
    }

@app.route("/webhook/voice", methods=["GET", "POST"])
def voice_webhook():
    response = VoiceResponse()

    response.say(
        "Hello! Welcome to Orbit AI. "
        "How can I help you today?",
        language="en-IN"
    )

    return str(response), 200, {
        "Content-Type": "application/xml"
    }

if __name__ == "__main__":
    app.run(host="0.0.0.0", port=5000)
```

2. requirements.txt

```
flask
twilio
gunicorn
```

3. Render deployment settings

Setting	Value
Service type	Web Service
Runtime / language	Python 3
Build command	pip install -r requirements.txt
Start command	gunicorn app:app

Create a GitHub repository named orbit-ai-backend. Add app.py and requirements.txt, commit them, then connect that repository to Render and deploy it as a Web Service.

4. Test the backend

After deployment, open your actual Render service URL in a browser. The root path (/) should return a JSON status response. The /webhook/voice path should return XML instructions for the greeting. Replace YOUR-SERVICE with the real Render service name.

```
https://YOUR-SERVICE.onrender.com/
https://YOUR-SERVICE.onrender.com/webhook/voice
```

5. Connect Twilio (optional)

In your Twilio phone number's incoming voice configuration, set the webhook URL to https://YOUR-SERVICE.onrender.com/webhook/voice and choose HTTP POST. Save and test an incoming call. A voice-capable number and a suitable Twilio account are required; availability and charges vary by country.

Important security and functionality notes

This is a starter example. It does not yet understand caller questions, connect to an AI model, store leads, or transfer calls. Before production use, validate Twilio request signatures, protect API keys and secrets, and review applicable call-recording, privacy, and consent requirements. Do not put private API keys in your GitHub repository or browser JavaScript.
